

**Creation of information and measurement system for cars and trucks based on surface acoustic accelerometers**

**State registration –0110U000033**

**Head -**

**Results**

Experimental studies of information-measuring system showed prospects for use such devices for vehicle security system and the measurement of stress-deforming state of railway locomotives. Combining them into a single complex with a satellite navigation system and a digital maps allow to accurately determine the position of the car on the road.
